                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "Mechanisms of evolution in Rickettsia conorii and R. prowazekii."; Science 293:2093-2098(2001).
-!- CATAL/YIC ACTIVITY: S-adenosyl-L-methionine + 3-demethylubiquinone-9 = S-adenosyl-L-homocysteine + ubiquinone-9.
-!- PATHWAY: Ubiquinone blosynthesis.
-!- PATHWAY: Ubiquinone blosynthesis.
-!- SIMILARITY: BELONGS TO THE UBIG/COQ3 FAMILY.
                                                                                                                                                                                                                                                                                                                                                         SEQUENCE FROM N.A.

-I- FUNCTION: ESSENTIAL FOR THE MITOTIC METAPHASE/ANAPHASE TRANSITION. POSITIVETY MODULATES PROTEIN PHOSPHATASE-1. POSSIBLY BY FORMING A PEPRATING HELICAL ROD THAT IS CAPABLE OF ENHANCING A PP1-DEPENDENT DEPHOSPHORYLATIVE AND ACTIVITY.

-I- SUBBUILT: PHYSICALLY INTERACTS WITH THE DISZ AND SDS21

SUBUNIT: CONTAINS A CORE (COMPOSED OF ALPHA, EPSILON, AND THETA SUBUNIT: CONTAINS A CORE (COMPOSED OF ALPHA, EPSILON, AND THETA DIMENIZATION TO FORM THE POILII' COMPLEX. POLIII' ASSOCIATES WITH THE GAMMA, DELIA, DELIA', PSI, AND CHI) AND WITH THE BETA CHAIN. THE FINAL COMPOSITION OF THE COMPLEX IS: (ALPHA, EPSILON, THETA) [2] - TAU[2] - (GAMMA, DELTA, DELTA', PSI, CHI) [2] - BETA [4]. THE BETA CHAIN IS AN HOMODIMER, WHEN NOT ASSOCIATED WITH THE OTHER COMPONENTS.

-!- FUNCTION: DNA POLYMERASE III IS A COMPLEX, MULTICHAIN ENZYME
RESPONSIBLE FOR MOST OF THE REPLICATIVE SYNTHESIS IN BACTERIA.
THIS DNA POLYMERASE ALSO EXHIBITS 3' TO 5' EXONUCLEASE ACTIVITY.
THE BETA CHAIN IS REQUIRED FOR INITIATION OF REPLICATION ONCE IT
IS CLAMPED ONTO DNA, IT SLILDE FREELY (BIDIRECTIONAL AND ATP-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Salmonella typhimurium.

d I'TH THE R2/8/PRS5/BS5, R3/8''/PR72/PR130/PRS9 AND R5/8'/BS6

FAMILIES), THE 48 kDa VARIABLE REGULATORY SUBUNIT, VIRAL PROTEINS, CONNOCCULES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AND CELL SIGNALING MOLECULES.
SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
TISSUE SPECIFICITY: HIGHEST LEVELS IN HEART, LIVER AND BRAIN. LOWER
LEVELS IN SKELETAL MUSCLE, SPLEEN, KIDNEY, AND LUNG.
SIMILARITY: BELONGS TO THE PHOSPHATASE 2A REGULATORY SUBUNIT B
                                                                                                                                                                                                                                  Tehrani M.A., Mumby M.C., Kamibayashi C., I "Identification of a novel protein phosphatase 2A regulatory subunit highly expressed in muscle.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

"High complexity in the expression of the B' subunit of protein
phosphatase 2Ao. Evidence for the existence of at least seven novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -!- SUBUNIT: PP2A CONSISTS OF A COMMON HETERODIMERIC CORE ENZYME,
COMPOSED OF A 36 kDa CATALYTIC SUBUNIT (5) AND A 65 kDa
COMPOSED OF A 36 kDa CATALYTIC SUBUNIT (5) THAT ASSOCIATES
WITH A VARIETY OF REGULATORY SUBUNITS. PROTEINS THAT ASSOCIATE
WITH THE CORE DIMER INCLUDE THREE FAMILIES OF REGULATORY SUBUNITS
B (THE R2/B/PR55/B55, R3/B*, /PR72/PR130/PR59 AND R5/B*/B56
FAMILIES), THE 48 kDa VARIABLE REGULATORY SUBUNIT, VIRAL PROTEINS,
AND CELL SIGNALING MOLECULES.
-!- SUBCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).
-!- TISSUE SPECIFICITY: HIGHER REPRESSED IN BRAIN.
-!- SILLARITY: BELONGS TO THE PHOSPHATASE 2A REGULATORY SUBUNIT B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      isoforms.";
J. Biol. Chem. 271:2578-2588(1996).
J. Biol. Chem. 271:2578-2588(1996).
-!- FUNCTION: THE B REGULATORY SUBUNIT MIGHT MODULATE SUBSTRATE SELECTIVITY AND CATALYTIC ACTIVITY, AND ALSO MIGHT DIRECT THE LOCALIZATION OF THE CATALYTIC ENZYME TO A PARTICULAR SUBCELLULAR
                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                   30-MAY-2000 (Rel. 39, Created)

C. I- FUNCTION: PIBRIN, HEBRAIN, DNA, AND ACTIN. FIBRONECTINS

C. I- FUNCTION: VARIANT (V+C)- IS PROBABLY INVOLVED IN MATRIX

C. I- FUNCTION: VARIANT (V+C)- IS PROBABLY INVOLVED IN MATRIX

C. I- FUNCTION: VARIANT (V+C)- IS PROBABLY INVOLVED IN MATRIX

C. I- FUNCTION: VARIANT (V+C)- IS PROBABLY INVOLVED IN MATRIX

C. I- FUNCTION: VARIANT (V+C)- IS PROBABLY INVOLVED IN MATRIX

C. I- FUNCTION: VARIANT (V+C)- IS PROBABLY INVOLVED IN MATRIX

C. I- FUNCTION: VARIANT IN SOME FORMS OF FIBRONECTING STRAND3;

C. I- ALTERNATIVE PRODUCTS: EACH OF THE "EXTRA DOMAIN" & THE CONNECTING STRAND3 ARE PRESENT IN SOME FORMS OF FIBRONECTIN AND ABSENT IN OTHERS. THESE DIFFERENCES ARE DUE TO A LISSUE SPECIFICITY: PLASMA FN (SOLUBLE DIMRRIC FORM) IS SECRETED BY HERDAUCTINES. THE CALLILAR FN (SOLUBLE DIMRRIC FORM)

BY HERPATOCYTES. CELLULAR FN (SOLUBLE DIMRRIC FORM) IS SECRETED BY HERPATOCYTES. CELLULAR MATRIX. VARIANT (V+C)- IS THE MAJOR TRANSCRIPT IN ARTICULAR CARTILAGE, BUT IT IS ABSENT FROM LUYER.

C. I- FUNCTION WALLEY FOR TRANSCRIPT IN ARTICULAR CARTILAGE, BUT IT IS ABSENT FROM LUYER.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ALTERNATIVE PRODUCTS: 3 ISOFORMS, DELTA-1 (SHOWN HERE), DELTA-2 AND DELTA-3, ARE PRODUCED BY ALTERNATIVE SPLICING.
TISSUE SPECIFICITY: ISOFORM DELTA-2 IS WIDELY EXPRESSED. ISOFORM DELTA-1 IS HIGHLY EXPRESSED IN BRAIN.
INDUCTION: BY RETINOTC ACID; IN NEUROBLASTOMA CELL LINES.
PTM: AT LEAST ISOFORM DELTA-1 IS PHOSPHORYLATED ON SERINE
                            SEQUENCE FROM N.A. (ISOFORM DELTA-2), AND SEQUENCE OF 501-508; 550-559; 573-580 AND 584-601 (DELTA-1).
TISSUE-Brain cortex, and Bone marrow;

-!- FUNCTION: Cooperates with MD-2 and TLR6 to mediate the innate immune response to bacterial lipoproteins and other microbial cell wall components. Acts via MyD88 and TRAF6, leading to NF-kappa-B activation, cytokine secretion and the inflammatory response. May also promote apoptosis in response to lipoproteins (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SUBUNIT: Binds MD-2 and TLR6 via the extracellular domain. Binds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Guionaud C.T., Dubey C., Zumkehr J.R., Sonstegard T.S., Jungi T.W., "Role of bovine TLR2, TLR4 and CD14 in the recognition of bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

"Cooperation of Toll-like receptor 2 and 6 for cellular activation 1 soluble tuberculosis factor and Borrelia burgdorferi outer surface protein A lipoprotein: role of Toll-interacting protein and IL-1 receptor signaling molecules in Toll-like receptor 2 signaling "; J. Immunol. 167:997-994(2001).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      FUNCTION: Participates in the innate immune response to Grampositive bacteria and fungi. Acts via MyD88 and TRAF6, leading to Desitive bacteria and fungi. Acts via MyD88 and TRAF6, leading to Trappara activation. To tytokine secretion and the inflammatory response. Recognizes mycoplasmal macrophage-activating lipopeptide-2kD (MALP-2), soluble tuberculosis factor (STF), phenol soluble modulin (FSM) and B.burgdorferi outer surface protein A lipoprotein (OSPA-L) cooperatively with TLR2. SUBUNIT: Binds TLR2 via their respective extracellular domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TISSUE-Placenta;

Binds MyD88 via their respective TIR domains (By similarity).

-!- SUBCELLULAR LOCATION: Type I membrane protein. Plasma membrane and phagosomes (By similarity).

-!- TISSUE SPECIFICITY: Detected in monocytes, CD11c+ immature dendritic cells, plasmacytoid pre-dendritic cells and dermal microvessel endothelial cells.

-!- SIMILARITY: BELONGS TO THE TOLL-LIKE RECEPTOR FAMILY.

-!- SIMILARITY: CONTAINS 1 TIR DOMAIN.

-!- SIMILARITY: CONTAINS 13 LEUCINE-RICH REPEATS (LRR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Science 281:375-388(1998).
-!- FUNCTION: DEGRADES SHORT-LIVED REGULATORY AND ABNORMAL PROTEINS IN
PRESENCE OF ATP. HYDROLYZES TWO ATPS FOR EACH PEPTIDE BOND CLEAVED
IN THE PROTEINS UBSTRATE (BY SIMILIARITY).
-!- CATALYTIC ACTIVITY: HYDROLYSES Of large protesins such as globin,
casein and denaturated serum albumin, in presence of ATP.
-!- SUBDINT: HONOTERPARER (BY SYMILIARITY).
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- SIMILARITY: BELONGS TO PEPTIDASE PAMILY $16.
                                                                                                                                                                                                                                                  STRAIN=Nichols;

-!- FUNCTION: BINDS TO IRON RESPONSIVE ELEMENTS (IRES), WHICH ARE STEM-LOOP STRUCTURES FOUND IN THE S'UTR OF PERRITIN, AND DELTA ANINOLEVULINIC ACID SYNTHASE MRNAS, AND IN THE 3'UTR OF TRANSFERRIN RECEPTOR MRNA. BINDING TO THE IRE ELEMENT IN PERRITIN RECULT TO THE TRANSFERRIN RECEPTOR MRNA INHIBITS THE DEGRADATION OF THIS OTHERWISE RAPIDLY DEGRADED MRNA.
-- CHALVITON: THIS PROPERIN ALSO EXPRESSES ACONITASE ACTIVITY.
-- CATALYTIC ACTIVITY: Citrate = cis-aconitate + H(2)O.
-- SUMILARITY: BELONGS TO THE ACONITASE/IPM ISOMERASE FAMILY.

CHAINS (BY SIMILARITY)

-!- SUBCELLULAR LOCATION: CONCENTRATED IN THE CELL BODY OF THE NEURONS, PARTICULARLY IN THE PERINUCLEAR REGION.
-!- DOMAIN: COMPOSED OF THEE STRUCTURAL DOMAINS: A LARGE GLOBULAR N-TERMINAL DOMAIN WHICH IS RESPONSIBLE FOR THE MOTOR ACTIVITY OF KINESIN (IT HYDROLYZES ATP AND BINDS MICROTUBULE), A CENTRAL ALPHA-HELICAL COILED COIL DOMAIN THAT MEDIATES THE HEAVY CHAIN DIMERIZATION; AND A SMALL GLOBULAR C-TERMINAL DOMAIN WHICH INTERACTS WITH OTHER PROFELIES: (SUCH AS THE KINESIN LIGHT CHAINS), VESICLES AND MEMBRANOUS ORGANELLES.
-!- SIMILARITY: BELONGS TO THE KINESIN-LIKE PROTEIN FAMILY. KINESIN
                                                                                                                                                                                                                                                                               MEDLINE-99000842; PubMed-9782088;
